Max Consecutive Ones

Solved ✓

Easy | Topics | Company Tags

You are given a binary array `nums`, return the maximum number of consecutive `1`'s in the array.

Example 1:

```
Input: nums = [1,1,0,1,1,1]

Output: 3
```

Example 2:

```
Input: nums = [1,0,1,1,0,1]

Output: 2
```

Solution 1 +

NeetBot | Hint | Ln 2, Col 52

```java
class Solution {
    public int findMaxConsecutiveOnes(int[] nums) {
        int count = 0;
        int max = 0;

        for (int num : nums) {
            if (num == 1) {
                count++;
                max = Math.max(max, count);
            } else {
                count = 0;
            }
        }

        return max;
    }
}
```

Append Characters to String to Make Subsequence

Solved ✓

Medium | Topics | Company Tags

You are given two strings `s` and `t` consisting of only lowercase English letters.

Return the minimum number of characters that need to be appended to the end of `s` so that `t` becomes a subsequence of `s`.

A **subsequence** is a string that can be derived from another string by deleting some or no characters without changing the order of the remaining characters.

Example 1:

```
Input: s = "coaching", t = "coding"

Output: 4
```

Explanation: Append the characters `"ding"` to the end of `s` so that `s = "coachingding"`.
Now, `t` is a subsequence of `s` (**coachingding**).
It can be shown that appending any `3` characters to the end of `s` will never

Solution 1 +

NeetBot | Hint | Ln 2, Col 5

```java
class Solution {
    public int appendCharacters(String s, String t) {
        int i = 0;
        int j = 0;

        while (i < s.length() && j < t.length()) {
            if (s.charAt(i) == t.charAt(j)) {
                j++;
            }
            i++;
        }

        return t.length() - j;
    }
}
```

Length Of Last Word

Solved ✓

Easy | Topics | Company Tags

You are given a string `s` consisting of words and spaces, return the length of the **last** word in the string.

A **word** is a maximal substring consisting of non-space characters only.

Note: A **substring** is a contiguous non-empty sequence of characters within a string.

Example 1:

```
Input: s = "Hello World"

Output: 5
```

Explanation: The last word is `"World"` with length `5`.

Example 2:

```
Input: s = "   fly me   to   the moon  "
```

Solution 1 +

NeetBot | Hint | Ln 7, Col 1

```java
class Solution {
    public int lengthOfLastWord(String s) {
        String[] words = s.trim().split(" ");
        return words[words.length - 1].length();
    }
}
```
